

FUCKING FUN (NOW WITH LESS RISK!)

PARTY & PLAY (PNP):

Having sex when you're high can be fun but can lead to a case of morning-after blues. Being high can make it hard to talk about safer sex and remember condoms. Set limits and having condoms with you before you get high or drink can help.

ANAL SEX, ASS FUCKING/FUCKING:

Unprotected anal sex is high risk for HIV and other STIs. The lining inside your ass is delicate and tiny tears make it possible for HIV to be transmitted. HIV is in pre-cum and bottoms can pass HIV on to unprotected tops.

POPPERS:

Can be fun during sex but can also lead to rougher play or getting lost in the moment and forgetting condoms. Poppers and hard-on drugs like Viagra lower your blood pressure and when mixed they can make you pass out or create heart problems.

E/COKE/K/CRYSTAL DICK:

Lots of guys take hard-on drugs like Viagra, when other drugs make it hard to get hard. This can mess with your blood pressure and lead to a stroke. It can also lead to erections that won't go down! *If you stay hard for 4 hours +, go to the ER!* You need that boner-blood pumped out. Ouch!

ALCOHOL:

Alcohol will enhance any drugs you take. Mixing alcohol with K can make you barf and GHB can knock you out. A lot of guys stick with one drink and one bump at a time.

ORAL SEX, SUCKING DICK, GIVING HEAD, BLOW JOBS:

Unprotected oral sex can put you at risk for STIs like gonorrhea, and throat fucking is risky for syphilis. Mouth sores, throat infections, recent dental work, brushing/flossing beforehand all can increase your risk. Wait at least 30 mins. after you brush/floss, and even longer after dental work, to help avoid this. Reduce your risk by using a condom every time!

RIMMING/ASS LICKING:

Unprotected rimming is high risk for STIs, like Hepatitis A. You can reduce the risk by using a latex barrier such as a dental dam or flavoured condom cut length-wise.
